
Connections with evidence

Research atlas

Maps of documented relationships, attributed reports, records and review pathways. Every edge says what it means. No map here establishes one coordinated targeting network.

Research cutoff: October 1, 2026
Version 1.0 | Source-checked working edition

Prepared with AI-assisted research. Source authority, case relevance and document authenticity must be evaluated separately. This is a research resource, not a certification of facts or a legal filing.

Contents

1 Read the edges before the pattern 2

1.1 The edge register 2

2 Source, assertion, finding 3

3 Olson: documented action and later review 4

8 A causal claim needs separate bridges 9

8.1 Biological and technological hypotheses 9

8.2 A status update is itself a map change 9

Source register 10

1 Read the edges before the pattern

An employment link, a report about a professional relationship, and evidence of operational direction are different edges. Co-location, similar symptoms and recurring words in headlines are not perpetrator links.

Solid relationship	Documented for the narrow label shown.
Dashed relationship	Attributed report or a proposed evidentiary step; see each plate’s legend.
No edge	No supported relationship asserted. Absence from a diagram does not prove nonexistence.
Arrow	Direction of a process, document, payment or instruction only as labeled.

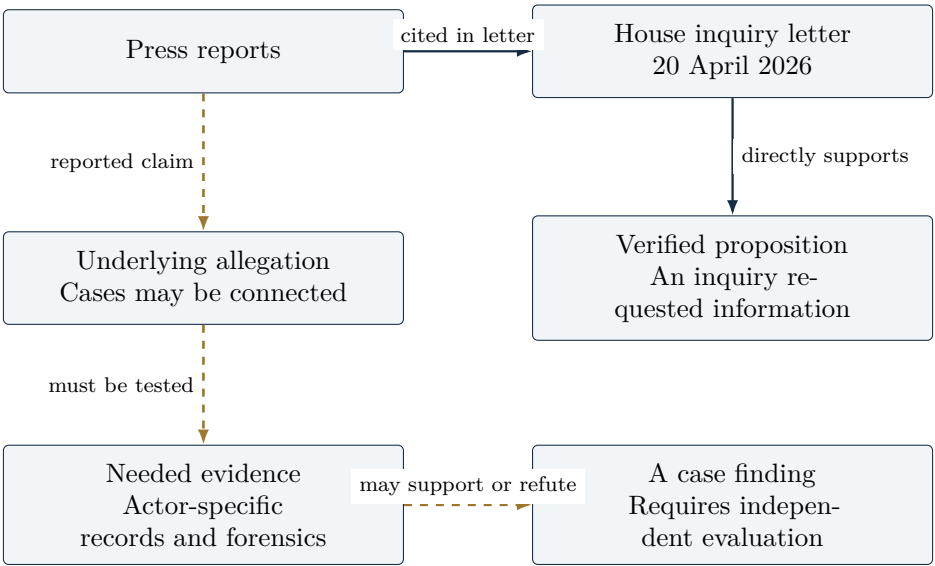

The atlas uses the dossier’s source IDs and research cutoff of October 1, 2026. These are relationship schematics, not geospatial intelligence or a statistical network analysis. The underlying evidence is uneven: official documents, mirrors and news accounts have different provenance limits. Consult the full dossier before reusing any assertion.

1.1 The edge register

The editable `data/connections.csv` states endpoints, relationship type, status, source and causal limitation. New edges require a record, a date, a pinpoint and an explanation of what the record establishes. A claim of coordination needs evidence of coordination, such as attributable instructions or transactions; it cannot be inferred from a dense-looking graph.

2 Source, assertion, finding

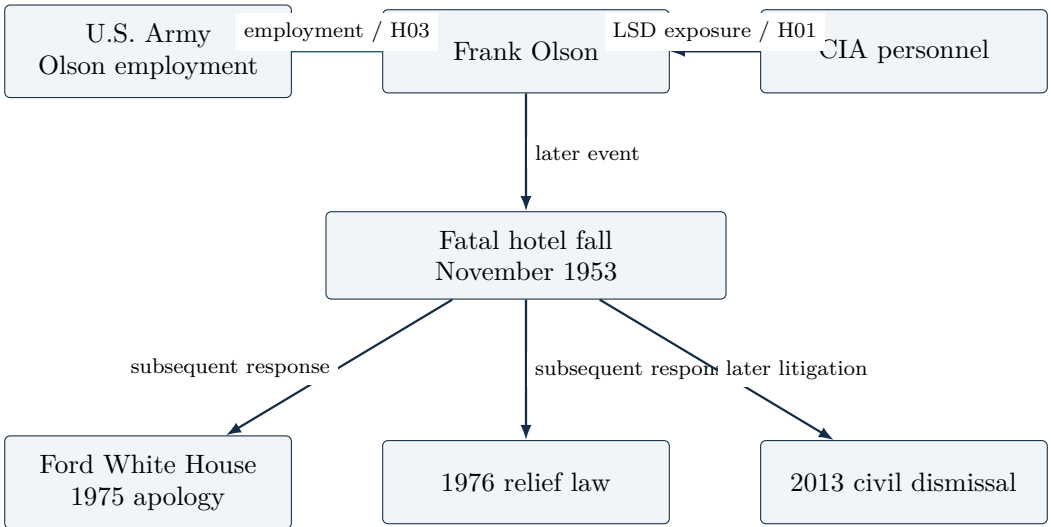

One source can establish that an allegation was made without establishing the allegation itself. The April 2026 House letter is a useful example.^[R01]

Solid arrows show document provenance. Dashed arrows show an unproven proposition and the work required to evaluate it. An inquiry cannot be used to close the evidentiary gap it was opened to investigate.

3 Olson: documented action and later review

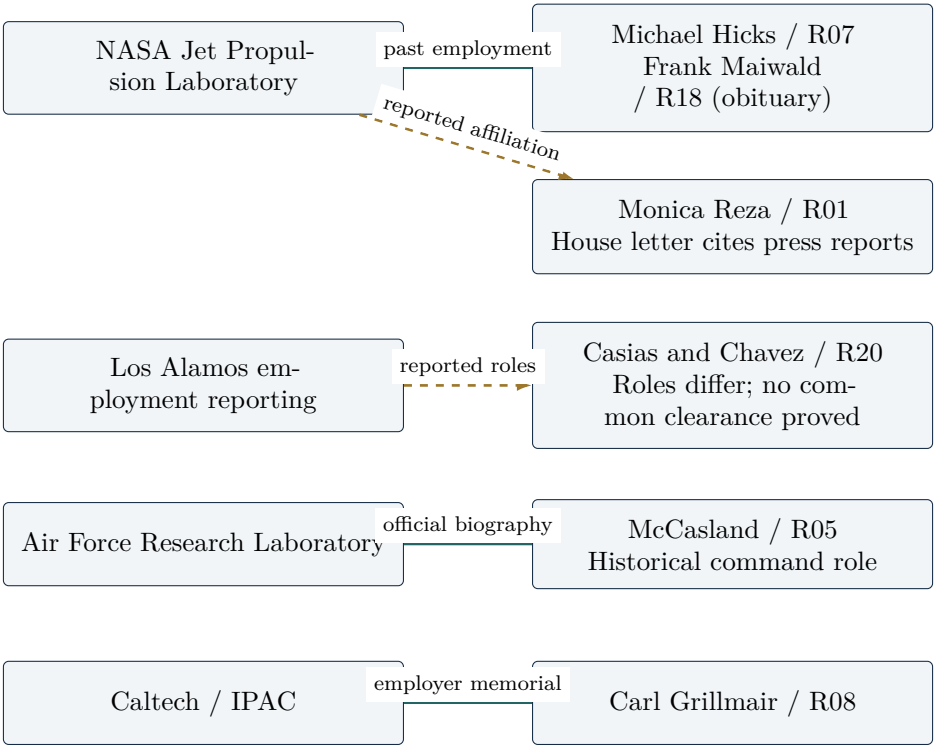

The historical record documents an exposure and institutional response. The manner of the fatal fall remains a separate contested proposition.[H01, H02, H03, H04]

Sequence does not alone establish a mechanism of death. The court opinion recounts a family allegation about later forensic findings; dismissal did not decide that the death was a homicide. The dossier retains conflicting historical date/floor descriptions.

4 Recent cases: affiliations are context

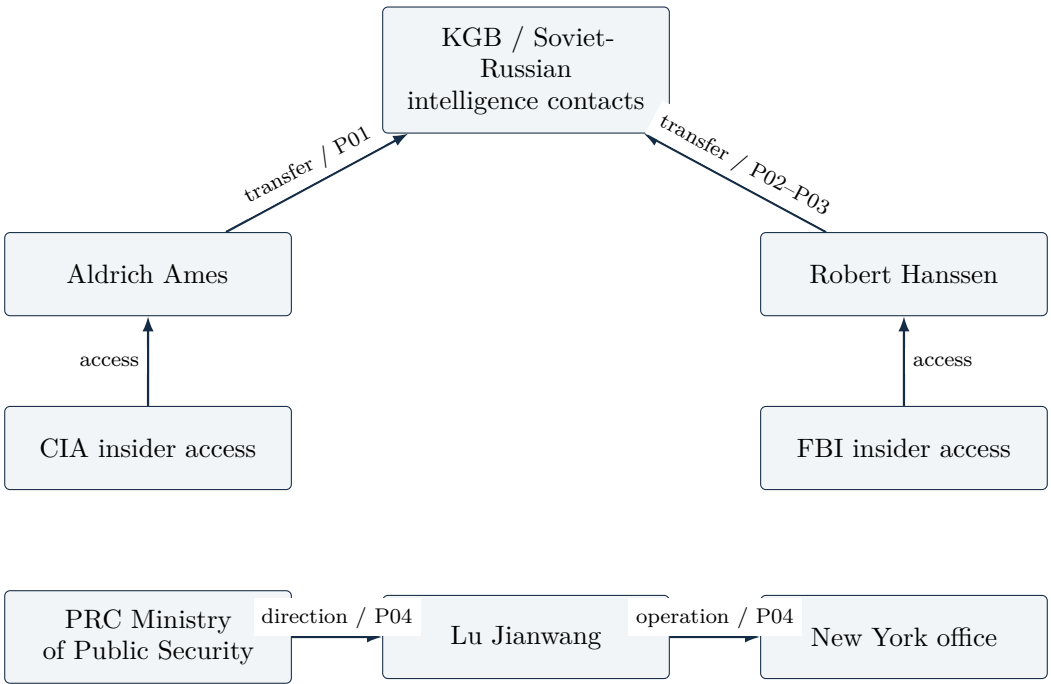

Employment and professional reporting define context; they do not make an incident a classified-work attack. Solid lines below are employer or society records; dashed lines are attributed reporting.[R05, R07, R08, R18, R01, R20]

No lines connect the incidents to each other. Maiwald is supported by an obituary rather than an employer record; its limits remain in the dossier. Casias is deceased in later records. Never infer current missing status from an affiliation map.

5 Specific foreign-domestic links: comparators

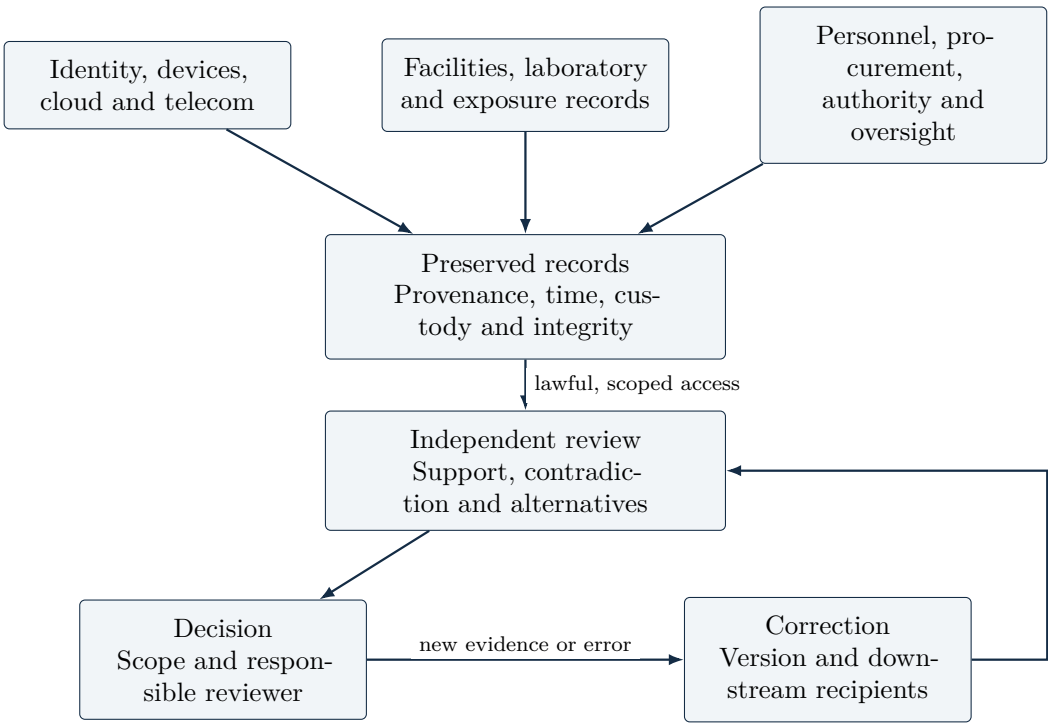

These established examples show the specificity needed for attribution. They are separate operations and are not asserted to connect the deaths.[P01, P02, P03, P04]

Each actor-to-operation link has specific evidence and a guilty plea or reported jury verdict. Nationality, ordinary international contact, institutional membership or shared scientific interests are not substitutes for that evidence.

6 Control points and a correction loop

Author-created defensive architecture informed by the control register. Boxes are review domains, not identified compromised systems.[C01, C02, C03, C12, C14, C15, C20]

Keep the source record, the interpretation and the decision distinct. An adverse output should remain traceable to its inputs, authority and reviewer. Correction should reach every recorded downstream use. This is a proposed architecture, not a statement that these safeguards already exist.

7 Jurisdiction atlas: where the records live

This is a records-location index, not a map of perpetrator movement. Specific access rights and custodians must be verified before submitting a request.[C16, C17]

Geography / subject	Case or context	Record lead and limitation
New York / federal archives	Olson	Scene/death records; Ford Library; Senate hearing; civil docket. Separate original findings from later allegations. [H01–H05]
Maryland	Colby	Medical examiner and recovery records. This packet’s autopsy is a third-party scan. [H06]
New Mexico	McCasland, Chavez, Garcia	Casias, Sheriff/state/local police and medical examiner records; dated missing notices can be stale. [R06, R11–R16]
California	Reza, Grillmair; JPL affiliations	Missing-person agency; prosecutor/court; employer records. Geography is not an operational link. [R07–R10, R18]
Massachusetts	Loureiro, Thomas	FBI and local investigative records; medical examiner; employer. [R03, R04, R17]
Virginia	Sullivan	Original medical-examiner determination and congressional scheduling documents needed. [R19]
Washington / federal	Woolsey; AHI assessments	Individual medical record access differs from public intelligence-assessment access. [W01–W07]
Moscow, Russia	Maganov	Autopsy, scene and final disposition not acquired. [W08]
Rayagada, India	Antov	Police and certified forensic records; later reporting describes accidental classification. [W10, W11]
Spain	Protosenya	Police, forensic and judicial records; staging allegation not established. [W09]

8 A causal claim needs separate bridges

Bridge	Potential evidence	What is insufficient alone
Event to exposure	Contemporaneous measurement; authenticated access records; independently reviewed samples	Symptoms, rumors, missing logs or device capability in the abstract.
Exposure to injury	Clinical timeline; qualified mechanism assessment; controls; alternative causes	Temporal sequence without dose, timing, mechanism or clinical assessment.
Actor to action	Attributable instructions, financial records, access logs, communications, forensic match	Motive, institutional position, nationality or being nearby.
Action to coordination	Independent links between identified people, transactions, assets and event dates	Shared employer; same vendor; a list selected after events occurred.
Finding to new case	New case's own records and legally relevant comparison	A historical abuse used as proof of a present allegation.

This plate is an analytic framework, not an adjudication or a diagnostic rule. The evidence manager and templates preserve uncertainty so that a reviewer can challenge each bridge.

8.1 Biological and technological hypotheses

Separate a general capability from demonstrated exposure, clinical effect and responsible actor. Lab safety failures, chemical exposure, medical coding error and malicious conduct require different tests. Use qualified clinicians, industrial hygienists, biosafety professionals and forensic examiners where appropriate. Do not infer an agent from a nonspecific symptom pattern or perform hazardous self-testing.[C09, C13, C15, W07]

8.2 A status update is itself a map change

When a source is corrected, recalled or superseded, update the case card, timeline, edge register, public narrative and downloadable release. The AHI recall and Casias identification illustrate why every public card needs a dated source and a revision path.[W04, R11]
